

# Open Roads Designer Application in Complex Projects

Presented By: : Travis Kluegel and Jeffrey Tardy

1

## Abstract

3D Design Technology

- Power and flexibility within complex, large-scale projects spanning multiple years

Utilizing ORD

- Modeling and quantification of over 900,000 cubic yards of staged earthwork within a \$225M interstate and interchange reconstruction

Earthwork

- Staged to account for multiple contracts, earthwork storage and access across construction seasons, realignment of the mainline interstate pavement
- Includes the conversion of an existing cloverleaf to a diverging diamond interchange

## Project Specific Challenges

● **bench**

19

## Best Practices Overview

● **bench**

20

## Best Practices: iModel as a Review Tool

- Designers designing in 3D – reviewers reviewing in 2D

Eliminate intermediate stage and artifacts by initiating reviews directly from your design models.

Streamline review process by collaborating in a 2D/3D hybrid design environment.

Avoid waiting time by working in an environment purpose-built for your discipline-specific reviews.

● **bench**

21

## Best Practices: Model Optimization

- Files are slow to open.....could be from:
  - Other programs running in the background
  - Loading individual dgn/bis
  - Intensive graphics (triangle, contours, mesh)

- Corridors are slow to process...could be from:
  - End condition processes that solve at each triangle
  - Civil rules/Civil cells processing time
  - Creation of final surfaces are based on the graphical filters instead of meshes

● **bench**

22

## Best Practices: Template and Corridor Management

- Separate data storage by dgn files
  - Superelevation, corridors, SUDA, geometry.....
  - Helps stability (and processing times)
- Consideration: Separate corridors by discipline or stage
  - One complete roadway corridor/template vs separate corridors
  - Troubleshooting
  - Earthwork calculations

● **bench**

23

## Best Practices: Template and Corridor Management

- Consideration: Separate corridors by discipline or stage
  - Earthwork calculations

● **bench**

24

## Best Practices: Template and Corridor Management

- Consideration: Separate corridors by discipline or stage
  - Allows for more flexible cross section annotation
- Utilize: Surface templates and projected profiles

● **bench**

25

## Best Practices: Item Types

- Item Types add Meta Data to Elements
  - Computed from OpenRoads Designer Properties
  - Includes calculated or conditional information
  - Excel "Pick List" and Lookup Functions

● **bench**

26

## Best Practices: Item Types

- Create displays rules to help view the meta data
- Add to feature definitions to auto populate
- Create Pay Item Reports from Corridor Objects
  - Bulk editing
  - Export to Excel

● **bench**

27

## Best Practices: SUDA

- The dgn is populated with seed file information once upon creation
- Stormcad database (stsw) is in the user temp folder, then syncs to ProjectWise
  - If this file is out of sync, the program crashes. (Synchronize Graphics may help)
- For stability, consider Separating Outlets by dgn

**Method to avoid?**

- **DO NOT** Press a file while in ProjectWise.
- **DO NOT** reference a file Drainage file of the same name.
- **DO NOT** copy a drainage file. Use Save As instead.
- When deleting nodes, delete the pipes connected to it FIRST and then delete the pipes. Same goes for Catchments.

● **NEVER USE THE UNDO BUTTON!**

● **bench**

28

## Best Practices: SUDA

Station	Profile	Height	Width	Area	Volume
1+00	Profile 1	10.00	25.00	25.00	25.00
1+20	Profile 1	10.50	25.00	25.00	25.00
1+40	Profile 1	11.00	25.00	25.00	25.00
1+60	Profile 1	11.50	25.00	25.00	25.00
1+80	Profile 1	12.00	25.00	25.00	25.00
2+00	Profile 1	12.50	25.00	25.00	25.00
2+20	Profile 1	13.00	25.00	25.00	25.00
2+40	Profile 1	13.50	25.00	25.00	25.00
2+60	Profile 1	14.00	25.00	25.00	25.00
2+80	Profile 1	14.50	25.00	25.00	25.00
3+00	Profile 1	15.00	25.00	25.00	25.00

● **bench**

29

## Best Practices: Sheet Creation and Annotation

- Sheet Seeds and Assembly
- Sheet Index
  - Separate by discipline
  - Populates the block info.
  - Allows for bulk edits
- Annotation groups and feature definitions

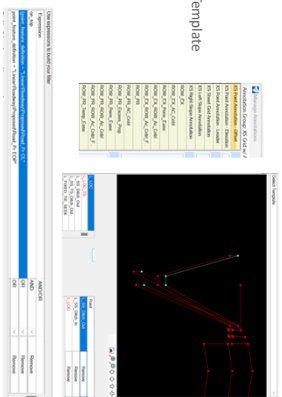

● **bench**

30

## Best Practices: Sheet Creation and Annotation

- Cross section template annotation
- Feature Definition & Template Point Selection

benesch

31

## Best Practices: Ongoing Software Developments

- Annotation Development
- Improved Item Types
- Pick List
- Expression Building
